

Checklist item	Answer options	Evidence to record	Risk signal	Suggested action	Related pathway
Q1 Function preserved	Yes, partly, no, unknown	Define the exact window function and performance level to be maintained	Function is unclear or performance is not equivalent between options	Define the functional unit before comparing strategies	All pathways
Q2 Short-life parts identified	Yes, partly, no, unknown	List likely wear components and expected failure points	Only the whole window is considered, not individual components	Create a component map distinguishing long-life and short-life parts	P1, P2, P5
Q3 Independent replacement possible	Yes, partly, no, unknown	Record whether glazing, seals, handles, fittings or hardware can be replaced separately	Product is called repairable but no component-level replacement route is confirmed	Request technical documentation and repair sequence from supplier	P1, P2
Q4 Practical repair enabled	Yes, partly, no, unknown	Check access, installation method, service clearance, tools, labour and maintenance instructions	Components are technically replaceable but difficult to reach after installation	Redesign detailing to allow future access and maintenance	P1
Q5 Actors and responsibilities clear	Yes, partly, no, unknown	Identify who supplies parts, performs repairs, maintains records and decides between repair and replacement	No actor is responsible for keeping repair possible over time	Assign responsibilities in specification, warranty and maintenance planning	P2, P7
Q6 Trade-offs identified	Yes, partly, no, unknown	Record extra materials, complexity, cost, transport, labour, service visits and upgrade limits	Circular strategy adds burdens that are not included in the decision	Compare scenarios and include uncertainty notes	P4, P6
Q7 Rebound or displacement checked	Yes, partly, no, unknown	Check whether repairability could encourage premature upgrading or shift burdens to other stages	Strategy may increase replacement frequency or hide impacts in transport or end of life	Apply repair-first hierarchy and classify possible unintended consequences	P3, P6, P7
Q8 Lifecycle benefit plausible	Yes, partly, no, unknown	Check assumptions for service life, repair frequency, spare parts, transport and end-of-life route	Benefit is claimed without evidence or transparent assumptions	Present the strategy as conditional and identify what must be verified	All pathways
