Feedback round	Practitioner feedback on preliminary screening framework
Framework reviewed	Circular Window Component and Rebound-Risk Check
Framework version shown	Initial Step 14 version
Practitioner	Stanislav Tasev
Role	Architect
Organisation	ST Architects
Previous interview ID	INT-02
Date of feedback	2026-06-26
Format	Written feedback
Permission to use feedback	Yes - feedback provided for use in the academic research project
Purpose of feedback	To check whether the preliminary framework is understandable, usable in architectural practice and correctly distinguishes rebound-related risks from ordinary implementation problems
Claim level	Practitioner-reviewed preliminary framework, not validated
Main feedback summary	The practitioner stated that the framework is understandable, can be used at any project stage, is best applied at the beginning of a project, and can also be applied to an already started project. No question was identified as unrealistic or difficult to answer. The practitioner stated that an architect would have enough information to use the framework, did not identify missing elements, and confirmed that the framework distinguishes rebound risks from ordinary implementation problems.
Main revision made	The framework was kept structurally unchanged. The report wording was clarified to state that the framework is best used early in the project, but may also be useful in later or already-started projects.
Remaining limitation	Feedback is based on one practitioner perspective and does not validate the framework statistically or empirically
